TECHNICAL BULLETIN

**RE: ProSpec Level Set 100
Application thickness change increase to 1.5" in a single pour**

ProSpec Level Set 100 is a portland cement-based, self-leveling underlayment that is used to level and smooth on, above or below grade concrete and solid wood floors for the installation of finished floor coverings.

The ProSpec Technical Team has made the decision to allow the Level Set 100 to be installed up to 1.5" in a single pour. The original application thickness allowance was up to 1" in a single pour.

It is the responsibility of the installer to ensure the suitability of the Level Set 100 for its intended use and must be installed in accordance with the current published technical data sheet.
